Allowable Subject Matter

Claims 20-26, 28-36 and 38-46 allowed.

The closest relevant arts are Harris et al (5,643,451) and Hammond et al (4,220,459).

Harris et al teach a filter bag for a filter device (30) comprising a tubular, flexible, air-penetrable filter body (34) provided with a suspension arrangement with a rigid ring element (30) arranged at least partially at an interior part (44) of the filter body (34) and being annularly secured to the unfolded end of the filter body (34), and the ring element (30) having an outwardly protruding member (32) for suspending the filter bag (34) at discrete points (see details of Fig. 2, col. 2, lines 6-26). Harris et al further teach the ring element (30) and the filter body (34) are bonded together via ultrasonic welding (col. 1, lines 29-41, col. 2, lines 27-60).

Hammond et al teach a filter bag for a filter device comprising a tubular, flexible, air-penetrable filter body (34) provided with a suspension arrangement with a rigid ring element (74) arranged at least partially at an interior part (76) of the filter body (34) and being annularly secured to the unfolded end of the filter body (34), and the ring element (74) having an outwardly protruding member (78, col. 3, line 58 through col. 4, line 6) for suspending the filter bag (34) at discrete points (see details of Fig. 2). Hammond et al further teach the ring element (74) and the filter body (34) are sewn (64) together (col. 3, lines 21-24), and the ring element (74) is made of metal or plastics materials (col. 3, lines 24-27).

Claims 20-26, 28-36 and 38-46 of this instant patent application differ from the disclosure of either Harris et al or Hammond et al in that the ring element includes a plurality of outwardly protruding members for suspending the filter bag at discrete points.
